Research Highlights

Identifying Rational Types in Unknown Environments under an Indirect Dynamic Mechanism

Humberto Bernal

- Models strategic state-insurgent interactions (FARC, ELN, AUC) via dynamic indirect screening.
- Mano de Dios–Guadalupe process embeds maximum-entropy noise to sustain Bayesian updating under conflict friction.
- Rational Type Identification Theorem proves almost-sure posterior separation of ideological versus criminal insurgent types.
- Microeconometric competing-risks hazards calibrate empirical kidnapping dynamics across four decades of Colombian conflict.
- Counter-terrorism policy evaluation quantifies structural trade-offs between financial interdiction (α) and tactical pressure (γ).
